

Organic Social Media Strategy — TrafficClaw

Context

Launch TrafficClaw on X and Reddit from scratch (no existing accounts). Must feel like a real person sharing something they built — not a brand advertising. Strategy is built on deep product analysis of what's genuinely unique.

What's Actually Unique (The Real Ammo)

After deep codebase analysis, these are features **no competitor has**:

Only TrafficClaw Does This	Why It Matters
AI chat that reads YOUR Google Analytics + Search Console data	ChatGPT gives generic SEO advice. TrafficClaw's AI knows your actual traffic, rankings, CTR. It says "your /pricing page has 78% bounce rate, that's costing you \$400/month" — not "optimize your landing pages."
Telegram bot as your SEO analyst (\$29/mo)	No analytics tool has a Telegram bot. You text it "how's my traffic?" from your phone and get a data-driven answer. Ahrefs charges \$99/mo and doesn't have this.
Real-time globe with "purchase warmth" prediction	GA4 shows "42 active users." TrafficClaw shows individual visitors on a 3D globe with warmth indicators predicting who's likely to buy. Each visitor has an estimated dollar value.
Revenue impact on every SEO issue	Other tools say "your CTR is low." TrafficClaw says "this keyword at position 3 with 2% CTR (should be 11%) is costing you \$480/month. Fix the title tag."
\$9-29/mo vs \$99-199/mo competitors	Ahrefs = \$99. SEMrush = \$120. TrafficClaw gives AI chat + audit + analytics + Telegram bot for \$29. The free tier alone beats GA4's UX.

Common problems it solves: 1. "I set up GA4 six months ago and never look at it because it's overwhelming" 2. "I don't know what to DO with my analytics data" 3. "I can't afford Ahrefs/

SEMrush just to track my keywords" 4. "I wish someone would just tell me what's wrong with my site"

Phase 1: Account Setup (Day 1)

X (Twitter)

- **Handle:** Your personal name (@divygoyal_ or similar) — NOT @TrafficClaw
- **Bio:** building things. currently: ai + analytics. prev: [whatever] — human, not brand
- **No product link in bio yet** — add after 1-2 weeks

Reddit

- **Username:** Personal (divybuilds or divygoyal_dev)
 - **Days 1-14:** Comment helpfully in r/webdev, r/nextjs, r/SEO, r/SideProject, r/startups. Build to 100+ karma before any posts.
-

Phase 2: Be a Person First (Week 1-2)

X — Posts That Build Presence (Zero Product Mention)

spent 3 hours debugging a useEffect infinite loop

dependency array had a state variable → callback recreated → interval restarted
→ state changed → callback recreated

refs. just use refs.

the gap between "google analytics is set up" and "i actually look at google analytics" is about 6 months for most founders

hot take: most SEO tools exist because google search console has the worst UX of any google product

and that's saying a lot

i found out today that if you rank position 3 on google, the expected CTR is 11%

most sites i've seen get 3-4% at that position

the difference is literally just the title tag. that's it. that's the whole thing.

the craziest stat i keep seeing:

people pay \$99/mo for ahrefs to track keywords they could see for free in search console

the data is RIGHT THERE. google just made the UI so bad nobody looks at it

Reddit — Just Be Helpful

- r/SEO: Answer questions about CTR benchmarks, title tags, ranking drops
- r/webdev: Help with Next.js, React, TypeScript questions
- r/SideProject: Give genuine feedback on others' projects
- r/startups: Share honest founder experiences

Rule: 0 product mentions during this phase.

Phase 3: Soft Reveal (Week 2-3)

Now you casually mention what you're working on. **Not a launch. A work-in-progress.**

X — The Key Posts

Post 1: The Globe (Your Viral Shot)

i added a 3D globe to my analytics dashboard that shows visitors appearing in real-time

i've mass produced zero work today because i can't stop watching dots appear

this is probably a problem

[30-second raw screen recording – phone filming laptop is fine]

Post 2: The AI That Knows Your Data

me: "why did my traffic drop"

my dashboard: "your CTR on 'best crm software' dropped from 8.2% to 3.1%. position is still 4. your title tag is generic – rewrite it. this is costing you ~\$340/month in lost clicks."

i built an ai that reads my actual google analytics data instead of giving generic tips and it's ruined every other tool for me

Post 3: The Telegram Bot

just texted my telegram bot "how's my traffic this week"

it pulled my google analytics, analyzed 28 days of data, found a CTR problem on 3 keywords, and told me exactly which title tags to fix

from my phone. while making coffee.

i built this and i still can't believe it works

[screenshot of actual telegram conversation]

Post 4: The Price Comparison

ahrefs: \$99/mo

semrush: \$120/mo

my thing: \$19/mo and it has an ai that actually reads your data

i'm probably pricing this wrong but honestly i just want people to use it

Post 5: The Honest Struggle

day [X] of building a saas alone

things working:

- ai chat gives genuinely useful answers about your site
- the globe is addictive
- a telegram bot that's basically your seo analyst in your pocket

things not working:

- nobody knows this exists
- i've mass produced zero tweets
- pricing is probably too cheap

shipping anyway

Post 6: The "Did You Know" Value Post

if you have keywords ranking position 4-20 on google with 500+ impressions
that's money sitting on the table

position 8 → position 3 = roughly 4x more clicks

i built a thing that finds these automatically but honestly you can do it yourself:

1. open search console
2. filter by position 4-20
3. sort by impressions (descending)
4. those top 10 keywords = your biggest opportunities

the title tag is usually the fix

Reddit — First Posts

r/SideProject:

Title: I've been building this alone for 6 months and finally showing someone

I got tired of opening GA4 in one tab, Search Console in another, and still not knowing what to actually DO about any of it.

So I built a dashboard that connects both and has an AI that tells you what's wrong. Not generic "optimize your meta tags" – it says "your /pricing page CTR is 2.1% at position 4. Expected is 7.5%. Rewrite the title. This is costing you ~\$200/month."

The feature I'm most proud of is probably the dumbest one – a 3D globe that shows your visitors in real-time with little avatar pins and "purchase warmth" indicators. It's completely unnecessary but I genuinely can't stop watching it.

Also built a Telegram bot version. You can text it "how's my traffic" from your phone and it answers with real data.

Free tier has 10 AI messages. \$9/mo for more. Feedback welcome – I genuinely don't know if anyone besides me wants this.

[screenshot of globe]

[screenshot of AI chat giving a specific verdict]

r/SEO (pure value, product is a footnote):

Title: I found \$2,000/month in missed clicks by doing one thing in Search Console

The process:

1. Go to Search Console → Performance
2. Filter: Position 1-10 (you're already on page 1)
3. Sort by impressions (descending)
4. For each keyword, check actual CTR vs expected:
 - Position 1: should be ~28%
 - Position 2: ~16%
 - Position 3: ~11%
 - Position 4-5: ~7.5%
 - Position 6-7: ~4.5%
 - Position 8-10: ~2.5%
5. Any keyword where your CTR is less than HALF of expected = bad title tag

I found 8 keywords where I was getting 2-3% CTR at positions 3-5. Expected was 7-11%. Just the title tags.

Fixed 5 of them. Seeing improvements on 3 already after 2 weeks.

The math: 1,000 impressions × 5% CTR improvement × \$2/click = \$100/month.
Per keyword.

I automated this calculation in a side project I'm building (shameless plug, it's free: [\[link\]](#)) but honestly a spreadsheet works too.

r/webdev (technical, not product):

Title: How I built a real-time visitor globe with Mapbox GL in Next.js
(and the bugs that took me days)

Wanted a live globe showing visitors for an analytics dashboard. Here's what I learned:

1. Dynamic imports with `ssr: false` are mandatory – mapbox-gl crashes in Node
2. DO NOT set `position: relative` on marker elements – causes drift during zoom/rotation. Let Mapbox control positioning entirely. Inner wrapper handles relative for child elements.
3. Marker cleanup: track every marker in a `ref Map<id, {marker, el, lngLat}>` and remove them all on unmount
4. Auto-rotation: `setInterval` nudging `center.lng`. But MUST stop on dragstart or it fights the user interaction
5. DiceBear avatars load async – need `onerror` fallback to initials

[GIF of the globe]

Code architecture: `dynamic(() => import('./RealtimeMapbox'), { ssr: false })` wrapping a memo'd `forwardRef` component with `useImperativeHandle` for the parent to toggle auto-pan.

Happy to answer questions about the Mapbox implementation.

Phase 4: Ongoing Rhythm (Week 3+)

X Content Mix

Type	Frequency	Tone
Dev life / hot takes	3x/week	Casual, opinionated
Screen recordings of features	2x/week	"look at this thing i made" energy
SEO/analytics tips (no product)	1x/week	Genuinely helpful
Honest founder updates	1x/week	Vulnerable, real numbers
Replies to others	5-10/day	Helpful, never self-promoting

Reddit Rules

- r/SideProject: 1 progress update per month
- r/SEO: 2 value posts per month, daily comments
- r/webdev: 1 technical post per month
- **10 helpful comments for every 1 product mention**
- **Never post the same content in multiple subreddits**
- **If you remove the link, the post should still be interesting**

The Viral Hooks (Ranked by Shareability)

1. **The Globe** — Screen recordings of visitors appearing in real-time are inherently shareable. This is your #1 visual asset.
 2. **"My AI found a \$X/month leak"** — Screenshots of AI giving specific revenue impact verdicts. People will screenshot and share these.
 3. **Telegram Bot Conversations** — Screenshots of texting a bot and getting real analytics back. This feels like the future.
 4. **Price Shock** — "\$19/mo vs Ahrefs \$99/mo" is a conversation starter every time.
 5. **CTR Benchmark Posts** — Pure value content that drives SEO traffic back to you.
-

What NOT to Do

- Never use "we" — you're one person, say "I built"
 - Never say "check it out" or "try it free" — say "here's the link if you're curious"
 - Never post polished marketing graphics — raw screenshots and screen recordings only
 - Never use hashtags on Reddit
 - Never post in multiple subreddits on the same day
 - Never buy followers or engagement
 - Never use words like "revolutionary" "game-changing" "powerful"
 - Never lead with features — lead with the problem or the feeling
 - If it sounds like it came from a marketing team, delete it and start over
-

Day-by-Day First 2 Weeks

Day	X	Reddit
1	Create account. Follow 50 people in SEO/dev/indie hacker space.	Create account. Subscribe to target subreddits.
2-3	Like and reply to 10+ posts genuinely. Post 1 dev observation.	Comment helpfully on 5 posts in r/webdev or r/SEO.
4-5	Post 1 SEO hot take. Reply to 10 more people.	Comment on 5 more posts. Answer a question.
6-7	Post 1 more observation. Keep engaging.	Keep commenting. Aim for 50+ karma.
8-9	Post the CTR benchmark content (no product).	Answer 3 more questions in r/SEO.
10	Post the "can't stop watching the globe" tweet + screen recording.	Post in r/webdev (Mapbox technical post).
11-12	Post the AI verdict screenshot. Keep engaging.	Post in r/SideProject (the big one).
13-14	Post the Telegram bot screenshot. Add product link to bio.	Post in r/SEO (value post with casual link).

Verification

- Before posting: read it out loud. Does it sound like a person or a brand?
- "Would my friend text me this?" test
- Remove the product link — is the post still interesting on its own?
- Check: does it lead with a feeling/problem, or with a feature list?
